V100R003

# **IPSTACK Application Guide**

Issue 01

Date 2014-10-10

## **Copyright © Huawei Technologies Co., Ltd. 2014. All rights reserved.**

No part of this manual may be reproduced or transmitted in any form or by any means without prior written consent of Huawei Technologies Co., Ltd. and its affiliates ("Huawei").

The product described in this manual may include copyrighted software of Huawei and possible licensors. Customers shall not in any manner reproduce, distribute, modify, decompile, disassemble, decrypt, extract, reverse engineer, lease, assign, or sublicense the said software, unless such restrictions are prohibited by applicable laws or such actions are approved by respective copyright holders.

## **Trademarks and Permissions**

HUAWEI,

HUAWEI, and

are trademarks or registered trademarks of Huawei Technologies Co., Ltd.

Other trademarks, product, service and company names mentioned may be the property of their respective owners.

## **Notice**

Some features of the product and its accessories described herein rely on the software installed, capacities and settings of local network, and therefore may not be activated or may be limited by local network operators or network service providers.

Thus, the descriptions herein may not exactly match the product or its accessories which you purchase.

Huawei reserves the right to change or modify any information or specifications contained in this manual without prior notice and without any liability.

## **DISCLAIMER**

ALL CONTENTS OF THIS MANUAL ARE PROVIDED "AS IS". EXCEPT AS REQUIRED BY APPLICABLE LAWS, NO WARRANTIES OF ANY KIND, EITHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE, ARE MADE IN RELATION TO THE ACCURACY, RELIABILITY OR CONTENTS OF THIS MANUAL.

TO THE MAXIMUM EXTENT PERMITTED BY APPLICABLE LAW, IN NO EVENT SHALL HUAWEI BE LIABLE FOR ANY SPECIAL, INCIDENTAL, INDIRECT, OR CONSEQUENTIAL DAMAGES, OR LOSS OF PROFITS, BUSINESS, REVENUE, DATA, GOODWILL SAVINGS OR ANTICIPATED SAVINGS REGARDLESS OF WHETHER SUCH LOSSES ARE FORSEEABLE OR NOT.

THE MAXIMUM LIABILITY (THIS LIMITATION SHALL NOT APPLY TO LIABILITY FOR PERSONAL INJURY TO THE EXTENT APPLICABLE LAW PROHIBITS SUCH A LIMITATION) OF HUAWEI ARISING FROM THE USE OF THE PRODUCT DESCRIBED IN THIS MANUAL SHALL BE LIMITED TO THE AMOUNT PAID BY CUSTOMERS FOR THE PURCHASE OF THIS PRODUCT.

## **Import and Export Regulations**

Customers shall comply with all applicable export or import laws and regulations and be responsible to obtain all necessary governmental permits and licenses in order to export, re-export or import the product mentioned in this manual including the software and technical data therein.

## **Privacy Policy**

To better understand how we protect your personal information, please see the privacy policy at <http://consumer.huawei.com/privacy-policy>.

# 1 FTP Application Scenarios

## 1.1 Creating an FTP Control Link

### 1.1.1 Reference Process

Command	Description
<code>AT^IPOPEN=1,"FTP","192.166.63.41",2 1,,"username", "password"</code>	Create a normal FTP control link; an FTP user is successfully logged in to FTP server.
<code>OK</code>	
<code>^IPSRVST:1,10,230</code>	

#### NOTE

- Only one FTP service can be enabled at a time.
- Before an FTP service is enabled, Internet configuration and FTP configuration must be completed.
- PDP must be activated.

### 1.1.2 Troubleshooting

Scenario	Possible Error Information	Solution
Create the link. <code>AT^IPOPEN=1,"FTP", "192.166.63.41", 21,,"username", "password"</code>	<b>+CME ERROR: The network has not been established yet</b>	Initialize the internal protocol stack before sending the command to create the link.
	<b>+CME ERROR: The link has been established already</b>	Try to open an already established link.

## 1.2 Configuring Data Transmission Mode

In FTP, data can be transferred (PUT or GET) in three different modes.

- **Transparent transmission mode:**

For GET operation, files will be downloaded from the server and the content will be displayed to the user.

For PUT operation, users shall enter the data to be transferred to the server followed by "+++" to indicate the end of file.

During the data transfer process, we cannot execute other AT commands.

- **Command transmission mode:**

For GET operation, contents of downloaded file from server will be displayed to users through **^IPDATA** report.

For PUT operation, users shall enter the data to be transferred using **AT^IPSENDEX** command

During the data transfer process, we can execute any other AT commands than GET and PUT.

- **Buffer mode:**

For GET operation, contents of downloaded file from server will be stored in a buffer.

And a **^IPSRV** report will be displayed which indicates whether there is data to be read. After that, users need to issue

**"AT^IPRCV=<link\_id>,<reqReceiveLength>"** to read the data from buffer. For more information on **AT^IPRCV**, please refer AT command document.

The size of the buffer is 65536 bytes.

PUT operation is similar as in command transmission mode.

During the data transfer process, we can execute any other AT commands than GET and PUT.

## 1.2.1 Reference Process

Command	Description
<b>AT^IPCFL=14,0</b>	Set data transmission mode to transparent transmission mode.
<b>OK</b>	
<b>AT^IPCFL=14,1</b>	Set data transmission mode to command transmission mode.
<b>OK</b>	
<b>AT^IPCFL=14,2</b>	Set data transmission mode to buffer transmission mode.
<b>OK</b>	

The **AT^IPCFL** command is used to set the processing mode for FTP file data. By default, transparent transmission mode is set. Users can change the data transmission mode as per the need specified in section 1.2 .

## 1.3 Configuring FTP Data Channel Mode

### 1.3.1 Reference Process

Command	Description
<b>AT^FTPCMD=1,PORT</b>	Configure the connection mode in PORT mode for downloading and uploading data.
<b>OK</b>	
<b>AT^FTPCMD=1,PASV</b>	Configure the connection mode in PASV mode for downloading and uploading data. The default mode is PASV mode.
<b>OK</b>	

- In PORT mode, the client creates the control channel and provides the data port number which it will be listening on. The server then creates the data channel with the client provided port.
- In PASV mode, the client creates both control channel and data channel.

PASV mode is generally used in scenarios where the server will not be able to setup the data channel; one of the major reasons for this would be the network firewall limitation.

## 1.4 Getting FTP File Size

### 1.4.1 Reference Process

Command	Description
<code>AT^FTPCMD=1,FILESIZE,"ftp.txt"</code>	Get the size of the file.
<code>^FTPCMD: "FILESIZE",25490</code>	
OK	

### 1.4.2 Troubleshooting

Scenario	Possible Error Information	Solution
File Size Command <code>AT^FTPCMD=1,FILESIZE,"ftp.txt"</code>	<b>+CME ERROR: The link has not been established yet</b>	Make sure that the file size operation link ID is established.
Get File Size for a big file (> 4GB) <code>AT^FTPCMD=1,FILESIZE,"ftp.rar"</code>	<b>ERROR</b>	The file size command will return ERROR if the file size is greater than 4 GB.

## 1.5 Downloading File Using "GET" Command in Transparent Mode

### 1.5.1 Reference Process

Command	Description
<code>AT^IPINIT="mhahuawei1.com"</code>	Initialize the internal protocol stack.
OK	
<code>AT^IPCFL=14,0</code>	Set data transmission mode to transparent mode. By default it will be in transparent mode only.
OK	
<code>AT^IPOPEN=1,"FTP","192.166.63.41",2,1,"username","password"</code>	Create the link.

OK

**^IPSRVST:1,10,230**

**AT^FTPCMD=1,PORT**

Set the FTP data channel mode to PORT mode for downloading and uploading the data. By default it will be PASV mode. For more information on when to use PORT or PASV mode refer section 1.3.1 .

OK

**AT^FTPCMD=1,GET,"ftp.txt"**

Give the FTP Get command for downloading data.

**CONNECT**

Hello

OK

**^IPSRVST: 1,11,1**

## 1.5.2 Troubleshooting

Scenario	Possible Error Information	Solution
<b>AT^FTPCMD=1,GET,"ftp.txt"</b>	<b>+CME ERROR: The link has not been established yet</b>	Make sure that the get operation link ID is established.

## 1.6 Downloading File Using "GET" Command in Command Mode

### 1.6.1 Reference Process

Command	Description
<b>AT^IPINIT="mhahuawei1.com"</b>	Initialize the internal protocol stack.
OK	
<b>AT^IPOPEN=1,"FTP","192.166.63.41",2 1,"username","password"</b>	Create the link.

---

OK

**^IPSRVST:1,10,230**

**AT^IPCFL=14,1**

Set data transmission mode to command mode.

OK

**AT^FTPCMD=1,PORT**

Set the FTP data channel mode to PORT mode for downloading and uploading the data. By default it will be PASV mode. For more information on when to use PORT or PASV mode refer section 1.3.1 .

OK

**AT^FTPCMD=1,GET,"ftp.txt"**

Give the FTP Get command for downloading data.

OK

**^IPDATA: 1, 5, Hello**

**^IPSRVST: 1,11,1**

---

## 1.7 Downloading File Using "GET" Command in Buffer Mode

### 1.7.1 Reference Process

Command	Description
<b>AT^IPINIT="mhahuawei1.com"</b>	Initialize the internal protocol stack.
OK	
<b>AT^IPOPEN=1,"FTP","192.166.63.41",2 1,,"username","password"</b>	Create the link.
OK	
<b>^IPSRVST:1,10,230</b>	
<b>AT^IPCFL=14,2</b>	Set data transmission mode to buffer mode.
OK	

---

**AT^FTPCMD=1,PORT**

Set the FTP data channel mode to PORT mode for downloading and uploading the data. By default it will be PASV mode. For more information on when to use PORT or PASV mode refer section 1.3.1 .

OK

**AT^FTPCMD=1,GET,"ftp.txt"**

Give the FTP GET command for downloading data.

OK

**^IPRCV: 1, 1****^IPSRVST: 1,11,1****AT^IPRCV=1,5**

This command is used to receive the data stored in the buffer.

**^IPRCV: 1,5**

Hello

OK

## 1.8 Uploading File Using "PUT" Command in Transparent Mode

### 1.8.1 Reference Process

Command	Description
<b>AT^IPINIT="mhahuawei1.com"</b>	Initialize the internal protocol stack.
OK	
<b>AT^IPOPEN=1,"FTP","192.166.63.41",2 1,"username","password"</b>	Create the link.
OK	
<b>^IPSRVST:1,10,230</b>	
<b>AT^IPCFL=14,0</b>	Set data transmission mode to transparent mode.
OK	

**AT^FTPCMD=1,PORT**

Set the FTP data channel mode to PORT mode for downloading and uploading the data. By default it will be PASV mode. For more information on when to use PORT or PASV mode refer section 1.3.1 .

OK

**AT^FTPCMD=1,PUT,"ftp.txt"**

Upload the data using this command. After completion of uploading, send +++ to terminate from the server.

Any character is forbidden in 900 ms before and after inputting "+++", and it must be less than 900 ms between two '+' input.

CONNECT

&lt;Enter the data&gt;

&lt;Type "+++" to terminate from the server&gt;

OK

**^IPSRVST: 1,11,1**

## 1.9 Uploading File Using "PUT" Command in Command Mode and Buffer Mode

There is no difference in PUT operation of "Command mode and Buffer mode". In both modes, **AT^IPSENDEX** is used to enter the data.

### 1.9.1 Reference Process

Command	Description
<b>AT^IPINIT="mhahuawei1.com"</b>	Initialize the internal protocol stack.
OK	
<b>AT^IPOPEN=1,"FTP","192.166.63.41",2 1,,"username","password"</b>	Create the link.
OK	
<b>^IPSRVST:1,10,230</b>	

<b>AT^IPCFL=14,2</b>	Set data transmission mode to buffer mode.
<b>OK</b>	
<b>AT^FTPCMD=1,PORT</b>	Set the FTP data channel mode to PORT mode for downloading and uploading the data. By default it will be PASV mode. For more information on when to use PORT or PASV mode refer section 1.3.1 .
<b>OK</b>	
<b>AT^FTPCMD=1,PUT,"ftp.txt"</b>	Upload the data using this command.
<b>OK</b>	
<b>AT^IPSENDEX=1,2,1500,0</b>	It can send maximum 1500 data at a time. The last parameter <eof> is 0 where 0 means can send more data.
<b>OK</b>	
<b>&lt;Enter the data&gt;</b>	
<b>^IPSENDEX:1</b>	
<b>OK</b>	
<b>AT^IPSENDEX=1,2,1500,1</b>	It can send maximum 1500 data at a time. The last parameter <eof> is 1, where 1 means end of packet and the file upload will be completed.
<b>OK</b>	
<b>&lt;Enter the data&gt;</b>	
<b>^IPSENDEX: 1</b>	
<b>OK</b>	
<b>^IPSRVST: 1,11,1</b>	
<b>AT^IPCLOSE=1</b>	Close the link.
<b>OK</b>	

## 1.10 Error Codes

<state code>	Meaning
100	The server has not responded
110	Restarts the mark reply
120	Prepares in n minutes
125	The connection opens the preparation to transmit
150	Opens the data connection
200	Command Execution Success
202	Command Execution Failure
211	System Status
212	List Status
213	FILE SIZE
214	Help information
215	Name system type
220	The new client prepared
221	Service closure pilot connection, may withdraw registers
225	The data connection opens, does not have the transmission to be in progress
226	That the closure data connection, requested file operation successfully
227	Enters the passive pattern
230	Successful Login
250	File operation of request completes
257	Setup PATH NAME
331	A user correctness, needs the password
332	When registers needs the account information
350	Next order
421	Cannot provide the service, closes the pilot connection
425	Cannot open the data connection
426	The closure connection, stops transmitting

# 2 HTTP Application Scenarios

## 2.1 Creating an HTTP Server Link

### 2.1.1 Reference Process

Command	Description
<code>AT^IPOPEN=1,"HTTP","m2m.huawei.com",9001</code>	Open a normal HTTP server link, an HTTP user is successfully logged in to HTTP.
OK	

**NOTE**

- Only one HTTP service can be enabled at a time.
- Before an HTTP service is enabled, Internet configuration and HTTP configuration must be completed.

### 2.1.2 Troubleshooting

Scenario	Possible Error Information	Solution
Create the link. <code>AT^IPOPEN=1,"HTTP","m2m.huawei.com",9001</code>	<b>+CME ERROR: The network has not been established yet</b>	Initialize the internal protocol stack before sending the command to create the link.
	<b>+CME ERROR: The link has been established already</b>	Try to open an already established link.

## 2.2 Configuring Data Transmission Mode

### 2.2.1 Reference Process

Command	Description
<b>AT^IPCFL=14,0</b>	Set data transmission mode to transparent transmission mode.
<b>OK</b>	
<b>AT^IPCFL=14,1</b>	Set data transmission mode to command transmission mode.
<b>OK</b>	
<b>AT^IPCFL=14,2</b>	Set data transmission mode to buffer transmission mode.
<b>OK</b>	

The **AT^IPCFL** command is used to set the data processing mode for HTTP, which is same as FTP.

By default, the transparent transmission mode is set. Users can change the data transmission mode as per the need specified in section 1.2 .

## 2.3 Downloading File Using "GET" Command in Transparent Mode

### 2.3.1 Reference Process

Command	Description
<b>AT^IPINIT="mhahuawe1.com"</b>	Initialize the internal protocol stack.
<b>OK</b>	
<b>AT^IPOPEN=1,"HTTP","m2m.huawei.com192.166.63.41",9001</b>	Create the link.
<b>OK</b>	
<b>AT^IPCFL=14,0</b>	Set data transmission mode to transparent mode. By default it will be in transparent mode only.
<b>OK</b>	
<b>AT^HTTPCMD=1,GET,http://m2m.huawei.com:9001/n_index.txt</b>	Download the file from the HTTP server n_index.txt (In the following example, <link_id> is 1).

**CONNECT**

hello123

OK

^IPSRVST: 1,12,200

## 2.3.2 Troubleshooting

Scenario	Possible Error Information	Solution
AT^HTTPCMD=1,GET,http://m2m.huawei.com:9001/n_index.html	+CME ERROR: The link has not been established yet	Make sure that the get operation link ID is established.

## 2.4 Downloading File Using "GET" Command in Command Mode

### 2.4.1 Reference Process

Command	Description
AT^IPINIT="mhahuawe1.com"	Initialize the internal protocol stack.
OK	
AT^IPCFL=14,1	Set data transmission mode to command mode
OK	
AT^IPOPEN=1,"HTTP","www.m2m.huawei.com",9001	Create the link.
OK	
AT^HTTPCMD=1,GET,http://m2m.huawei.com:9001/n_index.txt	Download the file from the HTTP server n_index.txt (In the following example, <link_id> is 1).
OK	
^IPDATA: 1,5,hello123	
^IPSRVST: 1,12,200	

## 2.5 Downloading File Using "GET" Command in Buffer Mode

### 2.5.1 Reference Process

Command	Description
<b>AT^IPINIT="mhahuawe1.com"</b> OK	Initialize the internal protocol stack.
<b>AT^IPOPEN=1,"HTTP","m2m.huawei.com",9001</b> OK	Create the link.
<b>AT^IPCFL=14,2</b> OK	Set data transmission mode to buffer transmission mode.
<b>AT^HTTPCMD=1,GET,http://m2m.huawei.com:9001/n_index.txt</b> OK	Download the file from the HTTP server n_index.txt (In the following example, <link_id> is 1)
<b>^IPRCV: 1,1</b> <b>AT^IPRCV=1,5</b> <b>^IPRCV: 1, 5</b> Hello	Receive the data stored in the buffer.
OK	

## 2.6 Uploading File Using "POST" Command in Transparent Mode

### 2.6.1 Reference Process

Command	Description
<b>AT^IPINIT="mhahuawe1.com"</b> OK	Initialize the internal protocol stack.
<b>AT^IPOPEN=1,"HTTP","m2m.huawei.com",9001</b>	Create the link.

---

<b>OK</b>	
<b>AT^IPCFL=14,0</b>	Set data transmission mode to online mode.
<b>OK</b>	
<b>AT^HTTPCMD=1,POST,HTTP://m2m.huawei.com:448/cgi-bin/textarea.cgi,20,"text/plain"</b>	Upload the data using this command .If the upload has to be cancelled, then give +++ to terminate.
<b>CONNECT</b>	
<b>textcontext=hello123</b>	
<b>Enter 20 bytes of data</b>	
<b>&lt;phtml&gt;&lt;head&gt;&lt;title&gt;Text Area - Fifth CGI Program&lt;/title&gt;&lt;/phead&gt;&lt;body&gt;&lt;h2&gt;EnteredText Content is hello123&lt;/h2&gt;&lt;/body&gt;&lt;/html&gt;</b>	
<b>OK</b>	
<b>^IPSRVST: 1, 12,200</b>	

---

## 2.7 Uploading File "POST" Command in Command Mode and Buffer Mode

There is no difference in HTTP POST operation of "Command mode and Buffer mode". In both modes, **AT^IPSENDEX** is used to enter the data.

### 2.7.1 Reference Process

---

Command	Description
<b>AT^IPINIT="mhahuawe1.com"</b>	Initialize the internal protocol stack.
<b>OK</b>	
<b>AT^IPOPEN=1,"HTTP","m2m.huawei.com",9001</b>	Create the link.
<b>OK</b>	
<b>AT^IPCFL=14,1</b>	Set data transmission mode to command mode.
<b>OK</b>	
<b>AT^HTTPCMD=1,POST,HTTP://m2m.huawei.com:448/cgi-bin/textarea.cgi,20,"text/plain"</b>	Upload the data content to the post script <b>textarea.cgi</b> .
<b>OK</b>	

---

**AT^IPSEND=1,"textcontext=hello123"**

Transmit the data through the link established (in this case, <link\_id> is 1).

**^IPSEND: 1**

**OK**

**^IPSRVST: 1,12,200**

**AT^IPSENDEX=1,0,"textcontent=hello123"**

Transmit the data through the link established in IPSENDEX Mode 0 (in this case, <link\_id> is 1).

**^IPSEND: 1**

**OK**

**^IPSRVST: 1,12,200**

**AT^IPSENDEX=1,2,20,1,textcontext=hello123**

Transmit the data through the link established in IPSENDEX Mode 2 (in this case, <link\_id> is 1).

**^IPSEND: 1**

**OK**

**^IPSRVST: 1,12,200**

**AT^IPSENDEX=1,1,"74657874636F6E74656E743D68"**

Transmit the data through the link established in IPSENDEX Mode 1 (in this case, <link\_id> is 1)

**^IPSEND: 1**

**OK**

**^IPSRVST: 1,12,200**

**AT^IPCLOSE=1**

Close the link.

**OK**

**NOTE**

The <textcontent> specifies the corresponding field in the POST Script.

## 2.7.2 Troubleshooting

Scenario	Possible Error Information	Solution
Close the specified link. <b>AT^IPCLOSE=&lt;link_id&gt;</b>	<b>+CME ERROR: Normal error</b>	The command is terminated. Run the <b>AT^IPCLOSE</b> command again.
Create the link. <b>AT^IPOPEN=1,"HTTP","m2m.huawei.com",9001</b>	<b>+CME ERROR: The network has not been opened yet</b>	Initialize the internal protocol stack before sending the command to create the link.
	<b>+CME ERROR: The link has been established already</b>	Run <b>AT^IPCLOSE</b> to close the corresponding link. Alternatively, change the link ID and send the command to create the link.
	<b>+CME ERROR: Fail to bind the specified port</b>	Change the local port number, or leave the local port number blank.
Query link information. <b>AT^IPOPEN?</b>	<b>OK</b>	No link information is available. Create a link, or accept the link as a server, and then query the link information again.
<b>AT^HTTPCMD=?</b>	<b>^HTTPCMD: (1-5),("GET","POST")</b>	Get the current HTTP command
<b>AT^HTTPCMD=1,GET,http://m2m.huawei.com:9001/n_index.html</b>	<b>+CME ERROR: The link has not been established yet</b>	Run <b>AT^IPOPEN</b> to open the link and then perform the download operation.
<b>AT^HTTPCMD=1,POST,"http://m2m.huawei.com:9001/cgi-bin/textarea.cgi",20,"text/index.html"</b>	<b>+CME ERROR: The link has not been established yet</b>	Run <b>AT^IPOPEN</b> to open the link and then perform the upload operation.

## 2.8 Error Codes

<state code>	Meaning
200	Operation successful
301	Moved permanently
302	Moved temporarily

<state code>	Meaning
401	Requested action requires authorization
403	Forbidden
404	Resource not found
405	Method not allowed on resource
406	Requested representation not accepted
408	Request timed out
410	Requested source is no longer available server
500	Internal server error
501	Requested HTTP operation not supported
505	HTTP version not supported

# 3 SMTP Application Scenarios

## 3.1 Creating an SMTP Server Link

### 3.1.1 Reference Process

Command	Description
<code>AT^IPOPEN=1,"smtp","192.166.63.41",25,, "m2mtest@m2m.huawei.com", "M2mhuawei"</code>	An SMTP user is successfully logged in to SMTP.
OK	
<code>^IPSRVST: 1,13,235</code>	

#### NOTE

- Only one SMTP service can be enabled at a time.
- Before an SMTP service is enabled, Internet configuration and SMTP configuration must be completed.

### 3.1.2 Troubleshooting

Scenario	Possible Error Information	Solution
Create the link. <code>AT^IPOPEN=1,"smtp","192.166.63.41",25,, "m2mtest@m2m.huawei.com", "M2mhuawei"</code>	<b>+CME ERROR: The network has not been established yet</b>	Initialize the internal protocol stack before sending the command to create the link.
	<b>+CME ERROR: The link has been established already</b>	Try to open an already established link.

## 3.2 Sending Mail Through "emsend" Without Attachment

### 3.2.1 Reference Process

Command	Description
<code>AT^IPOPEN=1,"smtp","192.166.63.41",25,,,"m2mtest@m2m.huawei.com","M2mhuawei"</code>	Create the link.
OK	
<code>^IPSRVST: 1,13,235</code>	
<code>AT^EMSEND=1,"m2mtest@m2m.huawei.com", "test with attachment", "utf-8",0</code>	Send mail without attachment.
>	
<ENTER THE BODY OF THE MAIL>	
<Press Ctrl+Z to end input>	
OK	
<code>^IPSRVST: 1,14,250</code>	

## 3.3 Sending Mail Through "emsend" with Attachment Using 7 bit

### 3.3.1 Reference Process

Command	Description
<code>AT^IPOPEN=1,"smtp","192.166.63.41",25,,,"m2mtest@m2m.huawei.com","M2mhuawei"</code>	Create the link.
OK	
<code>^IPSRVST: 1,13,235</code>	
<code>AT^EMSEND=1,"m2mtest@m2m.huawei.com", "test with attachment", "utf-8",1,"test.txt"</code>	Send mail with attachment using 7 bit algorithm.

---

>  
<ENTER THE BODY OF THE MAIL>  
<Press Ctrl+Z to end input>

OK

^IPSRVST: 1,14,250

AT^IPSENDEX=1,2,1500,0

It can send maximum 1500 data at a time. The last parameter i.e. <eof> can be 0 and 1, where 0 means can send more data and 1 means the last data to be send. This is an example on how to send 3000 bytes of attachment.

^IPSENDEX: 1

OK

AT^IPSENDEX=1,2,1000,0

Send 1000 bytes of data. The last parameter is 0, which means not end of file.

^IPSENDEX: 1

OK

AT^IPSENDEX=1,2,500,1

Send 500 bytes of data. The last parameter is 1, which means end of file.

^IPSENDEX: 1

OK

^IPSRVST: 1,14,250

---

## 3.4 Sending Mail Through "emsend" with Attachment Using base 64

### 3.4.1 Reference Process

Command	Description
AT^IPOPEN=1,"smtp","192.166.63.41",25,,"m2m	Create the link.

```

test@m2m.huawei.com","M2mhuawei"

OK

^IPSRVST: 1,13,235
AT^EMSEND=1,"m2mtest@m2m.huawei.
com","test with attachment", "utf-8",2,"test.txt"
Send mail with attachment
using base 64 algorithm.

>
<ENTER THE BODY OF THE MAIL>
<Press Ctrl+Z to send>

OK

^IPSRVST: 1,14,250
AT^IPSENDEX=1,2, 4,1
It can send maximum 1500
data at a time. The last
parameter i.e. <eof> can be
0 and 1, where 0 means
more data can be sent and 1
means the last data to be
send.

^IPSENDEX: 1

OK

^IPSRVST: 1,14,250
AT^IPCLOSE=1
Close the link.

OK

```

### 3.4.2 Troubleshooting

Scenario	Possible Error Information	Solution
Close the specified link. <b>AT^IPCLOSE=&lt;link_id&gt;</b>	<b>+CME ERROR: Normal error</b>	The command is terminated. Run the <b>AT^IPCLOSE</b> command again.
Create the link. <b>AT^IPOPEN=1,"smtp","192.166.63.41"</b>	<b>+CME ERROR: The network has not been opened yet</b>	Initialize the internal protocol stack before sending the command to create the link.

Scenario	Possible Error Information	Solution
,25,, "m2mtest@m2m.huawei.com", "M2mhuawei"	<b>+CME ERROR: The link has been established already</b>	Run <b>AT^IPCLOSE</b> to close the corresponding link. Alternatively, change the link ID and send the command to create the link.
	<b>+CME ERROR: Fail to bind the specified port</b>	Change the local port number, or leave the local port number blank.
Query link information. <b>AT^IPOPEN?</b>	<b>OK</b>	No link information is available. Create a link, or accept the link as a server, and then query the link information again.
<b>AT^SMTPCMD=?</b>	<b>^HTTPCMD: (1-5),("GET", "POS")</b>	Get the current HTTP command.
<b>AT^EMSEND=1, "m2mtest@m2m.huawei.com", "test with attachment", "ut f-8", 2, "test.txt"</b>	<b>+CME ERROR: The link has not been established yet</b>	Run <b>AT^IPOPEN</b> to open the link and then perform the download operation.

### 3.5 Error Codes

<state code>	Meaning
235	Authentication successful
250	Its typical side message is "Requested mail action okay completed": meaning that the server has transmitted a message.
354	The side message can be very cryptic ("Start mail input end <CRLF>.<CRLF>"). It's the typical response to the DATA command.
421	The service is unavailable due to a connection problem: it may refer to an exceeded limit of simultaneous connections, or a more general temporary problem.
450	"Requested action not taken – The user's mailbox is unavailable". The mailbox has been corrupted or placed on an offline server, or your email hasn't been accepted for IP problems or blacklisting.
451	"Requested action aborted – Local error in processing". Your ISP's server or the server that got a first relay from yours has encountered a connection problem.

<state code>	Meaning
452	Too many emails sent or too many recipients: more in general, a server storage limit exceeded.
500	A syntax error: the server couldn't recognize the command.
501	Another syntax error, not in the command but in its parameters or arguments.
502	The command is not implemented.
503	The server has encountered a bad sequence of commands, or it requires an authentication.
504	A command parameter is not implemented.
535	Authentication failure
550	It usually defines a non-existent email address on the remote side.
551	"User not local or invalid address – Relay denied". Meaning, if both your address and the recipient's are not locally hosted by the server, a relay can be interrupted.
552	"Requested mail actions aborted – Exceeded storage allocation": simply put, the recipient's mailbox has exceeded its limits.
553	"Requested action not taken – Mailbox name invalid". That is, there's an incorrect email address into the recipients line.
554	This means that the transaction has failed. It is a permanent error and the server will not try to send the message again.
555	Syntax error

# 4 FTPS, HTTPS and SMTPS in Secure Mode

---

## 4.1 Create a Secure Control Link

### 4.1.1 Preliminary Operations

Before initializing a secure socket and transmitting data over the secure channel, certain preliminary operations need to be performed which are mentioned below.

### 4.1.2 IP Configuration

CyaSSL requires IP configurations to be done to access the secure server over which data can be transmitted

#### To Configure APN

```
AT+CGDCONT=1,"IP","mhahuawei1.com"
```

OK

#### To check the APN settings

```
AT+CGDCONT?
```

```
+CGDCONT: 1,"IP","mhahuawei1.com","",0,0
```

OK

#### To get the Signal Strength

```
AT+CSQ
```

```
+CSQ: 28,99
```

OK

31 is the strongest, 0 is the weakest, and 99 for none.

## To get the registered network

AT+ COPS?

+COPS: 0,0,"Terminal MHA Net",2

OK

### 4.1.3 SSL And TLS

SSL and TLS are cryptographic protocols used over the Internet to provide secure data communication in client server architecture.

### 4.1.4 Certificates

The SSL module allows the storage of a server certificate. It is assumed that licensed version of CyaSSL contains certificates that will be unique for each device.

## 4.2 Configure SSL

Before opening an SSL socket and exchanging data through secure/normal socket, following steps need to be performed:

- Initialize SSL Library
- Enable the secure CyaSSL channel
- Configure the secure socket
- Certificate Management

### 4.2.1 Initialize SSL Library

Before opening a secure socket and exchanging data through it, the CyaSSL Library needs to be initialized. Once SSL service task is created, CyaSSL library is initialized internally and a CyaSSL context is created.

### 4.2.2 Enable CyaSSL

The first step to be done in order to exchange data through an SSL socket is enable the secure socket.

This can be done using the AT command AT^SSLEN:

**AT^SSLEN=<SSId>,<Enable>[,<Encode\_ok>]**

Where:

- <SSL\_id>: must be set to 1, for Security Socket ID available.
- <Enable>: indicates the desired status. 0 indicates to disable socket; 1 indicates to enable socket.
- <Encode\_ok>: This parameter is not useful in case of HTTPS, FTPS and SMTPS (optional, it will take the value as 1 by default).

Without entering this command, any attempt to set SSL parameters by means of an SSL command fails.

**Example**

Enable SSL socket 1:

AT^SSLEN=1,1

OK

### 4.2.3 Configure CyaSSL Socket

CyaSSL socket parameters can be configured using the AT command AT^SSLCFG.

**AT^SSLCFG=<SSL\_id>,<TimeOut>[,<cipher\_suit>,<security\_level>]**

Where:

- <SSL\_id>: must be set to 1, for Security Socket ID available.
- <TimeOut>: indicates default maximum blocking timeout. This is applicable only in case of non-blocking sockets. Time out may range from 1 to 60 seconds .
- <cipher\_suit>: set the value to 0, all the available cipher suites supported by CyaSSL are proposed to the server. It is responsibility of the remote server to select one of them.
- <security\_level>: the authentication mode
  - 0: SSL verify none: no authentication, no security data is needed at all.
  - 1: Server authentication mode: CA Certificate storage is needed (the most common case).
  - 2: Server or Client authentication mode: CA Certificate (server), Certificate (client) and Private Key (client) are needed.

The table below is the supported Cipher Suite List (currently Supported 15 Cipher Suites):

Value	Cipher_suites
0	All supported Ciphers
1	TLS_RSA_WITH_RC4_128_SHA
2	TLS_RSA_WITH_RC4_128_MD5
3	TLS_RSA_WITH_NULL_SHA
4	TLS_RSA_WITH_NULL_SHA256
5	TLS_RSA_WITH_AES_256_CBC_SHA
6	TLS_RSA_WITH_AES_128_CBC_SHA
7	TLS_RSA_WITH_AES_128_CBC_SHA256
8	TLS_RSA_WITH_AES_256_CBC_SHA256
9	TLS_RSA_WITH_3DES_EDE_CBC_SHA
10	TLS_DHE_RSA_WITH_AES_256_CBC_SHA

Value	Cipher_suites
11	TLS_DHE_RSA_WITH_AES_128_CBC_SHA
12	TLS_DHE_RSA_WITH_AES_128_CBC_SHA256
13	TLS_DHE_RSA_WITH_AES_256_CBC_SHA256
14	SSL_RSA_WITH_RC4_128_SHA
15	SSL_RSA_WITH_RC4_128_MD5

### Example

CyaSSL socket configuration:

```
AT^SSLCFG=1,60,0,1
```

OK

## 4.2.4 Manage SSL Certificates

If the server or peer authentication needs to be done, all root CA certificates of server, client certificate and private key are required (Refer <security\_level> in section 4.2.3 )

Certificates can be loaded using AT^SSLMNG AT command.

**AT^SSLMNG=<SSL\_id>,<data\_type>,<action>,<file\_name>,[<package\_id>,<total\_no\_of\_packages>,<cert\_info>],[<password>]**

- <SSL\_id>: SSL socket ID.
  - 1: Secure socket connection
- <data\_type>: identifies the certificate or key to be stored.
  - 0: Certificate of the client (module). It is needed when the Server or Client authentication mode has been configured.
  - 1: CA certificate of the remote server, it is used to authenticate the remote server. It is needed when <scur\_level> parameter of AT^SSLCFG command is set to 1 or 2.
  - 2: RSA private key of the client (module). It is needed if the Server or Client authentication mode has been configured.
- <action>:
  - 0: Store certificate
  - 1: Delete certificate
  - 2: Load certificate
- <file\_name>: the file name for "". The maximum length of the file name is 255. And we are supporting only \*.pem type files only.
- <package\_id>: package identification number (1–10).
- <total\_no\_of\_packages>: total number of packages after splitting the Base 64 encoded format certificate data of each package of size maximum of 1024 bytes (1–10).
- <cert\_info>: string type, broken certificate package (converted into Base 64 encoded format before splitting the package) data (1–1024 bytes).

FURSBLRVktLS0tLQo="
```

OK

Once the configuration is done, we can perform FTPS, HTTPS and SMTPS operations.

### 4.3 Examples

Examples given are showing how to make secure connection for FTPS, HTTPS and SMTPS.

### 4.3.1 FTPS

Command	Description
<b>AT^IPINIT="mhahuawei1.com"</b>	Initialize the internal protocol stack.
<b>OK</b>	
<b>AT^SLEN=1,1,1</b>	Enable a secure socket.
<b>OK</b>	
<b>AT^SSLCFG=1,30,0,1</b>	Configure the properties of a secure socket.
<b>OK</b>	
<b>AT^IPOPEN=2,"FTPS","192.166.63.41", 990,,"username","password"</b>	Create a secure FTP control link, an FTP user is successfully logged in to FTP server.
<b>OK</b>	
<b>^IPSRVST:1,10,230</b>	

GET and PUT operations are the same as in normal FTP.

### 4.3.2 HTTPS

Command	Description
<b>AT^IPINIT="mhahuawei1.com"</b>	Initialize the internal protocol stack.
<b>OK</b>	
<b>AT^SLEN=1,1,1</b>	Enable a secure socket.
<b>OK</b>	
<b>AT^SSLCFG=1,30,0,1</b>	Configure the properties of a secure socket.
<b>OK</b>	
<b>AT^IPOPEN=3,"HTTPS","m2m.huawei. com",448</b>	Create a secure HTTP server link, an HTTP user is successfully logged in to HTTP server.
<b>OK</b>	

GET and POST operations are the same as in normal HTTP.

### 4.3.3 SMTPS

Command	Description
<b>AT^IPINIT="mhahuawei1.com"</b>	Initialize the internal protocol stack.
<b>OK</b>	
<b>AT^SSLEN=1,1,1</b>	Enable a secure socket.
<b>OK</b>	
<b>AT^SSLCFG=1,30,0,1</b>	Configure the properties of a secure socket.
<b>OK</b>	
<b>AT^IPOPEN=1,"smtps","192.166.63.41",25,,"m2mtest@m2m.huawei.com", "M2mhuawei"</b>	Create a secure SMTP server link, an SMTP user is successfully logged in to SMTP server.
<b>OK</b>	
<b>^IPSRVST:1,13,235</b>	

Sending emails (EMSEND) operation is the same as in normal SMTP.

# 5 Abbreviations

Abbreviations	Full spelling
APN	Access Point Name
FTP	File Transfer Protocol
HTTP	Hyper Text Transfer Protocol
SMTP	Simple Mail Transfer Protocol
SSL	Secure Socket Layer
TLS	Transport Layer Security
